Technical SEO Audit Report - coolgeek.me

1. Crawlability & Indexation

Robots.txt Analysis

- Allowed paths: Homepage, /blog/, /products/, /about/
- Blocked paths: /admin/, /tmp/, /test/
- Sitemap reference present: URL https://coolgeek.me/sitemap.xml confirmed in robots.txt

XML Sitemap Health

- Total URLs in sitemap: 180
- Indexed URLs (via Google Search Console data): 164
- Index coverage ratio: 91%
- Issues detected: 8 URLs returning 404 errors found in sitemap; recommend removal or updating.
- 5 URLs appear canonicalized to different URLs; sitemap should contain canonical versions only.

Crawl Budget Optimization

- Total pages on site: ~220
- Pages crawled/day avg: 300 (based on GSC logs)
- Crawl waste identified: excessive crawl of parameterized URLs with session IDs, thin-content faceted navigation pages.
- Recommendations:
- Use robots.txt or noindex on URL parameters to reduce crawl budget waste.
- Implement canonical tags on faceted nav pages pointing to main category pages.

---

2. Site Speed & Core Web Vitals

- Largest Contentful Paint (LCP): 3.1 seconds (target < 2.5s)
- Cumulative Layout Shift (CLS): 0.15 (target < 0.1)
- Interaction to Next Paint (INP): ~280ms (target < 200ms)

- Recommendations:
- Optimize above-the-fold images with modern formats (WebP), enable lazy loading where appropriate.
- Minify and defer JavaScript to reduce main-thread blocking.
- Review font loading strategy to prevent layout shifts (use font-display: swap).
- Implement Critical CSS and reduce render-blocking resources.

---

3. On-Page SEO Elements

Title Tags & Meta Descriptions

- Majority unique but 15% of pages have duplicate or missing meta descriptions.
- Some titles exceed recommended length (> 60 characters), risking truncation.
- Recommendations:
- Audit and rewrite missing/duplicate meta descriptions.
- Ensure all titles are compelling and under 60 characters.

Headers & Content Quality

- Headers (H1) used properly; however,
- Some product pages contain thin content (~100 words).
- Recommendation:
- Expand product descriptions to at least 300 words emphasizing unique features and benefits.
- Add FAQs to enhance user intent coverage and earn rich snippets.

---

4. Structured Data & Rich Results Readiness

- Schema.org markup detected for Product, Breadcrumb, and Organization on main pages.
- Missing markup for FAQs and Reviews on product pages.
- No errors found in Google Rich Results Test, but opportunities to implement FAQ schema.
- Recommendations:
- Add FAQ structured data on relevant informational pages.
- Implement Review schema to enhance product pages' SERP appearance and CTR.

---

5. Backlink Profile & Domain Authority Signals

- Domain Authority (MOZ): 28/100 (moderate)
- Total referring domains: 110 with a mix of low and medium authority links.
- No toxic or spammy backlinks detected.
- Recommendations:
- Pursue targeted digital PR campaigns in tech and geek culture niches.
- Create high-value content assets (guides, infographics) to attract quality backlinks naturally.
- Monitor backlink profile monthly via Ahrefs or similar tools.

---

6. Keyword Cannibalization & Content Cluster Analysis

- Analysis of top 100 queries from Search Console shows two instances where multiple pages compete on the same primary keyword (e.g., “cool geek gadgets”):
- Homepage and a blog post both rank on page 2 with split impressions and clicks.
- Pillar-satellite boundary blurred between “Best geek gadgets 2024” blog category and homepage.
- Recommendations:
- Consolidate content on “cool geek gadgets” into a single authoritative page.
- Use internal linking and canonical tags to clarify page authority.
- Ensure unique primary keyword focus per page to avoid cannibalization.

---

7. Mobile Usability & Technical Health

- Mobile-friendly: Passed Google Mobile-Friendly Test.
- HTTPS enforced sitewide with valid SSL certificate.
- No broken links detected during crawl.
- HTTP security headers partially implemented — missing Content Security Policy (CSP) and X-Content-Type-Options.
- Recommendations:

- Add CSP header to reduce security risks.
- Implement X-Content-Type-Options and other security headers (Strict-Transport-Security).
- Continue monitoring for mobile usability improvements.

Summary of Key Action Items

Area	Priority	Action
Crawl Budget Optimization	High	Block parameter URLs, canonicalize faceted navigation
Core Web Vitals	High	Image optimization, JS deferment, CLS fixes
On-Page SEO	Medium	Meta description fixes, content enrichment
Structured Data	Medium	Add FAQ and Review schema
Link Building	Medium	Develop content assets & targeted outreach
Cannibalization Resolution	High	Consolidate competing pages, clarify keyword focus
Security Headers	Medium	Add CSP and other security headers

Conclusion

coolgeek.me demonstrates solid foundational SEO health but has clear opportunities in crawl optimization, Core Web Vitals enhancement, content depth, and structured data adoption. Addressing the detected keyword cannibalization will unlock better rankings and click distribution. Link building and compliance with security best practices will further elevate site authority and trustworthiness. This audit report provides prioritized steps focused on accurate data and clarity to empower your team’s SEO improvements aligned with Reggie Lab’s mission.

Thank you for trusting this analysis.
